

Recall: invertible functions:  (6)

A matrix is invertible when

multiplication (on the left) by this matrix is ^{an} invertible linear transformation / function.

Question: ~~invertible~~ invertible. How many solutions of $\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 5 \\ 6 \end{bmatrix}$ one?

How to find inverses: Gauss-Jordan:

$$\left[\begin{array}{ccc|ccc} 1 & 2 & 0 & 1 & 0 & 0 \\ 2 & 1 & 1 & 0 & 1 & 0 \\ -1 & 0 & -1 & 0 & 0 & 1 \end{array} \right] \xrightarrow{R_2 - 2R_1, R_3 + R_1} \left[\begin{array}{ccc|ccc} 1 & 2 & 0 & 1 & 0 & 0 \\ 0 & -3 & 1 & -2 & 1 & 0 \\ -1 & 0 & -1 & 0 & 0 & 1 \end{array} \right]$$

$$\xrightarrow{R_3 + R_1} \left[\begin{array}{ccc|ccc} 1 & 2 & 0 & 1 & 0 & 0 \\ 0 & -3 & 1 & -2 & 1 & 0 \\ 0 & 2 & -1 & 1 & 0 & 1 \end{array} \right] \xrightarrow{R_1 \leftrightarrow R_3} \left[\begin{array}{ccc|ccc} 1 & 0 & -1 & 0 & 0 & -1 \\ 0 & -3 & 1 & -2 & 1 & 0 \\ 0 & 2 & -1 & 1 & 0 & 1 \end{array} \right]$$

$$\xrightarrow{R_2 \div -3} \left[\begin{array}{ccc|ccc} 1 & 0 & -1 & 0 & 0 & -1 \\ 0 & 1 & -1/3 & 2/3 & -1/3 & 0 \\ 0 & 2 & -1 & 1 & 0 & 1 \end{array} \right] \xrightarrow{R_3 - 2R_2} \left[\begin{array}{ccc|ccc} 1 & 0 & -1 & 0 & 0 & -1 \\ 0 & 1 & -1/3 & 2/3 & -1/3 & 0 \\ 0 & 0 & -1/3 & -1/3 & 2/3 & 1 \end{array} \right]$$

$$\xrightarrow{R_2 - R_3} \left[\begin{array}{ccc|ccc} 1 & 0 & -1 & 0 & 0 & -1 \\ 0 & 1 & 0 & 1 & -1 & -1 \\ 0 & 0 & -1/3 & -1/3 & 2/3 & 1 \end{array} \right] \xrightarrow{R_3 \cdot (-3)} \left[\begin{array}{ccc|ccc} 1 & 0 & 0 & 0 & 0 & -1 \\ 0 & 1 & 0 & 1 & -1 & -1 \\ 0 & 0 & 1 & -1 & -2 & -3 \end{array} \right]$$

$$\xrightarrow{R_1 - R_3} \left[\begin{array}{ccc|ccc} 1 & 0 & 0 & -1 & 2 & 2 \\ 0 & 1 & 0 & 1 & -1 & -1 \\ 0 & 0 & 1 & -1 & -2 & -3 \end{array} \right]$$

Check!

$$\begin{bmatrix} 1 & 2 & 0 \\ 2 & 1 & 1 \\ -1 & 0 & -1 \end{bmatrix} \begin{bmatrix} -1 & 2 & 2 \\ 1 & -1 & -1 \\ 1 & -2 & -3 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\begin{bmatrix} -1 & 2 & 2 \\ 1 & -1 & -1 \\ 1 & -2 & -3 \end{bmatrix} \begin{bmatrix} 1 & 2 & 0 \\ 2 & 1 & 1 \\ -1 & 0 & -1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Why does this work? Look at each column after

the bar: $\left[\begin{array}{ccc|c} 1 & 2 & 0 & 1 \\ 2 & 1 & 1 & 0 \\ -1 & 0 & -1 & 0 \end{array} \right], \left[\begin{array}{ccc|c} 1 & 2 & 0 & 0 \\ 2 & 1 & 1 & 1 \\ -1 & 0 & -1 & 0 \end{array} \right], + \dots$

We are solving the equation: $A \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, + \dots$

We are finding the vectors $\begin{bmatrix} x \\ y \\ z \end{bmatrix}$ that go to $\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, \dots$

We are computing $T^{-1} \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, T^{-1} \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}, T^{-1} \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} :$

~~The~~ The matrix associated to T^{-1} is:

$$\left[T^{-1} \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \quad T^{-1} \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} \quad T^{-1} \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} \right], \text{ which is what we did!}$$

Question: If A, B invertible, is AB invertible?

Yes: $(AB)^{-1} = B^{-1}A^{-1}$.

Why is T^{-1} linear?

$$T^{-1}(\vec{v} + \vec{w}) = T^{-1}(T(\vec{x}) + T(\vec{y})) = \vec{x} + \vec{y} = T^{-1}(\vec{v}) + T^{-1}(\vec{w})$$
