

# COENDS ARE COLIMITS

PABLO S. OCAL

ABSTRACT. This note gives an explicit description of why and how coends are colimits, without claiming any originality. Given  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  a functor, we construct a category  $\mathbf{Tw}(\mathcal{C}^{op})^{op}$  and functors  $\wr : \mathbf{Func}(\mathcal{C}^{op} \times \mathcal{C}, \mathcal{D}) \rightarrow \mathbf{Func}(\mathbf{Tw}(\mathcal{C}^{op})^{op}, \mathcal{D})$ ,  $\Phi : \mathbf{Cocone}(\wr T) \rightarrow \mathbf{Cowedge}(T)$ , and  $\Psi : \mathbf{Cowedge}(T) \rightarrow \mathbf{Cocone}(\wr T)$  such that

$$\int^{x \in \mathcal{C}} T(x, x) \cong \Phi(\mathbf{colim}(\wr T)) \quad \text{and} \quad \Psi\left(\int^{x \in \mathcal{C}} T(x, x)\right) \cong \mathbf{colim}(\wr T).$$

## 1. DEFINITIONS AND FUNCTORIALITY OF COENDS

**Definition 1.1.** Let  $\mathcal{C}, \mathcal{D}$  be categories, let  $S, T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  be functors. A *dinatural transformation*  $\alpha : S \rightrightarrows T$  is a family of morphisms  $\alpha_c : S(c, c) \rightarrow T(c, c)$  satisfying that for every morphism  $f : c \rightarrow c'$  in  $\mathcal{C}$  the following diagram commutes.

$$(1.2) \quad \begin{array}{ccccc} & & S(c, c) & \xrightarrow{\alpha_c} & T(c, c) & & \\ & S(f, \text{id}_c) \nearrow & & & & \searrow T(\text{id}_c, f) & \\ S(c', c) & & & & & & T(c, c') \\ & S(\text{id}_{c'}, f) \searrow & & & & \nearrow T(f, \text{id}_{c'}) & \\ & & S(c', c') & \xrightarrow{\alpha_{c'}} & T(c', c') & & \end{array}$$

**Definition 1.3.** Let  $\mathcal{B}, \mathcal{D}$  be categories, let  $d$  be an object in  $\mathcal{D}$ . The *constant functor*  $\Delta_d : \mathcal{B} \rightarrow \mathcal{D}$  sends every object  $b$  in  $\mathcal{B}$  to  $d$ , and every function  $f : b \rightarrow b'$  in  $\mathcal{B}$  to  $\text{id}_d$ .

**Definition 1.4.** Let  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  be a functor. A *cowedge* for  $T$  is a dinatural transformation  $\alpha : T \rightrightarrows \Delta_d$  where  $d$  is an object in  $\mathcal{D}$ . Given  $\alpha : T \rightrightarrows \Delta_d$  and  $\alpha' : T \rightrightarrows \Delta_{d'}$  cowedges for  $T$ , a *morphism of cowedges*  $g : \alpha \rightarrow \alpha'$  for  $T$  is given by a morphism  $g : d \rightarrow d'$  in  $\mathcal{D}$  such that for every object  $c$  in  $\mathcal{C}$  the following diagram commutes.

$$(1.5) \quad \begin{array}{ccc} & T(c, c) & \\ \alpha_c \swarrow & & \searrow \alpha'_c \\ d & \xrightarrow{g} & d' \end{array}$$

Note that a cowedge  $\alpha : T \rightrightarrows \Delta_d$  for  $T$  is given by specifying an object  $d$  in  $\mathcal{D}$  and a family of morphisms  $\alpha_c : T(c, c) \rightarrow d$  satisfying that for every morphism  $f : c \rightarrow c'$  in  $\mathcal{C}$  the following diagram

---

*Date:* November 2024.

*2020 Mathematics Subject Classification.* 18A30.

*Key words and phrases.* Cocone, coend, colimit, cowedge.

commutes.

$$(1.6) \quad \begin{array}{ccc} T(c', c) & \xrightarrow{T(f, \text{id}_c)} & T(c, c) \\ T(\text{id}_{c'}, f) \downarrow & & \downarrow \alpha_c \\ T(c', c') & \xrightarrow{\alpha_{c'}} & d \end{array}$$

Let  $\text{Cowedge}(T)$  be the *category of cowedges* for  $T$ . Its vertices are cowedges for  $T$ , and its arrows are morphisms of cowedges for  $T$ .

**Definition 1.7.** Let  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  be a functor. A *coend* of  $T$  is an initial object in  $\text{Cowedge}(T)$ .

If a coend of  $T$  exists, it is unique up to unique isomorphism, and we denote its corresponding object in  $\mathcal{D}$  by  $\int^{x \in \mathcal{C}} T(x, x)$ . The coend  $\iota : T \twoheadrightarrow \Delta_{\int^{x \in \mathcal{C}} T(x, x)}$  of  $T$  satisfies that given a cowedge  $\alpha : T \twoheadrightarrow \Delta_d$  of  $T$  then there exists a unique morphism  $h : \int^{x \in \mathcal{C}} T(x, x) \rightarrow d$  such that  $\alpha_c = h\iota_c$  for every object  $c$  in  $\mathcal{C}$ . Equivalently, for all objects  $c, c'$  in  $\mathcal{C}$  and all morphisms  $f : c \rightarrow c'$  the following diagram commutes.

$$(1.8) \quad \begin{array}{ccc} T(c', c) & \xrightarrow{T(f, \text{id}_c)} & T(c, c) \\ T(\text{id}_{c'}, f) \downarrow & & \downarrow \iota_c \\ T(c', c') & \xrightarrow{\iota_{c'}} & \int^{x \in \mathcal{C}} T(x, x) \\ & \searrow \alpha_{c'} & \downarrow h \\ & & d \end{array}$$

In this note we assume that the coend of a functor always exists. Let  $S : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$ ,  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$ , and  $U : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  be functors. We denote by  $\vartheta : S \twoheadrightarrow \Delta_{\int^{x \in \mathcal{C}} S(x, x)}$ ,  $\iota : T \twoheadrightarrow \Delta_{\int^{x \in \mathcal{C}} T(x, x)}$ , and  $\nu : U \twoheadrightarrow \Delta_{\int^{x \in \mathcal{C}} U(x, x)}$  the coends of  $S$ ,  $T$ , and  $U$  respectively.

**Definition 1.9.** Let  $S : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  and  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  be functors, let  $\eta : S \twoheadrightarrow T$  be a natural transformation, and let  $c$  be an object in  $\mathcal{C}$ . We define

$$(1.10) \quad \alpha(S, T, \eta)_c := \iota_c \eta_{c, c} : S(c, c) \rightarrow \int^{x \in \mathcal{C}} T(x, x).$$

We denote by  $\alpha(S, T, \eta)$  the family of morphisms  $\{\alpha(S, T, \eta)_c : S(c, c) \rightarrow \int^{x \in \mathcal{C}} T(x, x)\}_c$ .

**Proposition 1.11.** Let  $S : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  and  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  be functors, and let  $\eta : S \twoheadrightarrow T$  be a natural transformation. Then  $\alpha(S, T, \eta)$  is a cowedge for  $S$ .

*Proof.* Given  $f : c \rightarrow c'$  a morphism in  $\mathcal{C}$ , the naturality of  $\eta$  yields  $T(\text{id}_{c'}, f)\eta_{c', c} = S(f, \text{id}_c)\eta_{c, c}$  and  $T(f, \text{id}_c)\eta_{c', c} = S(\text{id}_c, f)\eta_{c', c'}$ . We thus have

$$\begin{aligned} \alpha(S, T, \eta)_c S(f, \text{id}_c) &= \iota_c \eta_{c, c} S(f, \text{id}_c) = \iota_c T(f, \text{id}_c) \eta_{c', c} \\ &= \iota_{c'} T(\text{id}_{c'}, f) \eta_{c', c} = \iota_{c'} \eta_{c', c'} S(\text{id}_{c'}, f) = \alpha(S, T, \eta)_{c'} S(\text{id}_{c'}, f). \end{aligned}$$

Namely, the following diagram commutes.

$$\begin{array}{ccccc}
S(c', c) & \xrightarrow{S(f, \text{id}_c)} & S(c, c) & & \\
\downarrow S(\text{id}_{c'}, f) & \searrow \eta_{c', c} & \downarrow T(\text{id}_{c'}, f) & \xrightarrow{T(f, \text{id}_c)} & \downarrow \iota_c \\
S(c', c') & & T(c', c) & \xrightarrow{\quad} & T(c, c) \\
& \searrow \eta_{c', c'} & \downarrow T(\text{id}_{c'}, f) & & \downarrow \iota_c \\
& & T(c', c') & \xrightarrow{\iota_{c'}} & \int^{x \in \mathcal{C}} T(x, x)
\end{array}$$

□

Since  $\alpha(S, T, \eta)$  is a cowedge for  $S$ , there exists a unique morphism in  $\mathcal{D}$  making the following diagram commute for all objects  $c$  in  $\mathcal{C}$ .

$$\begin{array}{ccc}
S(c, c) & \xrightarrow{\alpha(S, T, \eta)_c} & \\
\downarrow \vartheta_c & \searrow & \\
\int^{x \in \mathcal{C}} S(x, x) & \xrightarrow{\int^{x \in \mathcal{C}} \eta_{x, x}} & \int^{x \in \mathcal{C}} T(x, x)
\end{array}$$

We denote said morphism by  $\int^{x \in \mathcal{C}} \eta_{x, x} : \int^{x \in \mathcal{C}} S(x, x) \rightarrow \int^{x \in \mathcal{C}} T(x, x)$ .

**Theorem 1.12.** *The assignment*

$$\begin{array}{ccc}
\text{Func}(\mathcal{C}^{op} \times \mathcal{C}, \mathcal{D}) & \longrightarrow & \mathcal{D} \\
T & \longmapsto & \int^{x \in \mathcal{C}} T(x, x) \\
\eta & \longmapsto & \int^{x \in \mathcal{C}} \eta_{x, x}
\end{array}$$

*yields a functor*  $\int^{x \in \mathcal{C}} : \text{Func}(\mathcal{C}^{op} \times \mathcal{C}, \mathcal{D}) \rightarrow \mathcal{D}$ .

*Proof.* Note that  $\int^{x \in \mathcal{C}}$  is well defined because  $\int^{x \in \mathcal{C}} T(x, x)$  is an object in  $\mathcal{D}$  and  $\int^{x \in \mathcal{C}} \eta_{x, x}$  is a morphism in  $\mathcal{D}$  by the above discussion. Given an object  $c$  in  $\mathcal{C}$  then

$$\alpha(T, T, \text{id}_T)_c = \iota_c(\text{id}_T)_{c, c} = \iota_c \text{id}_{T(c, c)} = \iota_c = \text{id}_{\int^{x \in \mathcal{C}} T(x, x)} \iota_c.$$

Thus  $\text{id}_{\int^{x \in \mathcal{C}} T(x, x)} : \int^{x \in \mathcal{C}} T(x, x) \rightarrow \int^{x \in \mathcal{C}} T(x, x)$  and  $\int^{x \in \mathcal{C}} (\text{id}_T)_{x, x} : \int^{x \in \mathcal{C}} T(x, x) \rightarrow \int^{x \in \mathcal{C}} T(x, x)$  both make the following diagram commute.

$$\begin{array}{ccc}
T(c, c) & \xrightarrow{\alpha(T, T, \text{id}_T)_c} & \\
\downarrow \iota_c & \searrow & \\
\int^{x \in \mathcal{C}} T(x, x) & \xrightarrow[\text{id}_{\int^{x \in \mathcal{C}} T(x, x)}]{\int^{x \in \mathcal{C}} (\text{id}_T)_{x, x}} & \int^{x \in \mathcal{C}} T(x, x)
\end{array}$$

The uniqueness of said morphism implies  $\int^{x \in \mathcal{C}} (\text{id}_T)_{x,x} = \text{id}_{\int^{x \in \mathcal{C}} T(x,x)}$ , so  $\int^{x \in \mathcal{C}}$  preserves identities. Given natural transformations  $\eta : S \rightarrow T$  and  $\theta : T \rightarrow U$  in  $\text{Func}(\mathcal{C}^{op} \times \mathcal{C}, \mathcal{D})$  and an object  $c$  in  $\mathcal{C}$  then

$$\begin{aligned} \alpha(S, U, \theta\eta)_c &= \nu_c(\theta\eta)_{c,c} = \nu_c\theta_{c,c}\eta_{c,c} = \alpha(T, U, \theta)_c\eta_{c,c} = \int^{x \in \mathcal{C}} \theta_{x,x}\iota_c\eta_{c,c} \\ &= \alpha(S, T, \eta)_c = \int^{x \in \mathcal{C}} \theta_{x,x}\alpha(S, T, \eta)_c = \int^{x \in \mathcal{C}} \theta_{x,x} \int^{x \in \mathcal{C}} \eta_{x,x}\vartheta_c \end{aligned}$$

Namely, the following diagram commutes.

$$\begin{array}{ccccc} S(c, c) & \xrightarrow{\eta_{c,c}} & T(c, c) & \xrightarrow{\theta_{c,c}} & U(c, c) \\ \vartheta_c \downarrow & \searrow \alpha(S, T, \eta)_c & \downarrow \iota_c & \searrow \alpha(T, U, \theta)_c & \downarrow \nu_c \\ \int^{x \in \mathcal{C}} S(x, x) & \xrightarrow{\int^{x \in \mathcal{C}} \eta_{x,x}} & \int^{x \in \mathcal{C}} T(x, x) & \xrightarrow{\int^{x \in \mathcal{C}} \theta_{x,x}} & \int^{x \in \mathcal{C}} U(x, x) \end{array}$$

So  $\int^{x \in \mathcal{C}} (\theta\eta)_{x,x} : \int^{x \in \mathcal{C}} S(x, x) \rightarrow \int^{x \in \mathcal{C}} U(x, x)$  and  $\int^{x \in \mathcal{C}} \theta_{x,x} \int^{x \in \mathcal{C}} \eta_{x,x} : \int^{x \in \mathcal{C}} S(x, x) \rightarrow \int^{x \in \mathcal{C}} U(x, x)$  both make the following diagram commute.

$$\begin{array}{ccc} S(c, c) & & \\ \vartheta_c \downarrow & \searrow \alpha(S, U, \theta\eta)_c & \\ \int^{x \in \mathcal{C}} T(x, x) & \xrightarrow{\int^{x \in \mathcal{C}} (\theta\eta)_{x,x}} & \int^{x \in \mathcal{C}} T(x, x) \\ & \xrightarrow{\int^{x \in \mathcal{C}} \theta_{x,x} \int^{x \in \mathcal{C}} \eta_{x,x}} & \end{array}$$

The uniqueness of said morphism implies  $\int^{x \in \mathcal{C}} (\theta\eta)_{x,x} = \int^{x \in \mathcal{C}} \theta_{x,x} \int^{x \in \mathcal{C}} \eta_{x,x}$ , so  $\int^{x \in \mathcal{C}}$  preserves composition of morphisms.  $\square$

**Definition 1.13.** Let  $T : \mathcal{J} \rightarrow \mathcal{C}$  be a functor and let  $c$  be an object in  $\mathcal{C}$ . A *cocone* from  $T$  to  $c$  is a family of morphisms  $\phi_j : T(j) \rightarrow c$  for each object  $j$  in  $\mathcal{J}$  satisfying that for every morphism  $f : j \rightarrow j'$  in  $\mathcal{J}$  the following diagram commutes.

$$(1.14) \quad \begin{array}{ccc} T(j) & \xrightarrow{T(f)} & T(j') \\ & \searrow \phi_j & \swarrow \phi_{j'} \\ & c & \end{array}$$

Given  $\{\phi_j : T(j) \rightarrow c\}_{\mathcal{J}}$  and  $\{\phi'_j : T(j) \rightarrow c'\}_{\mathcal{J}}$  cocones, a *morphism of cocones*  $g : \phi \rightarrow \phi'$  is given by a morphism  $g : c \rightarrow c'$  in  $\mathcal{C}$  such that for every object  $j$  in  $\mathcal{J}$  the following diagram commutes.

$$(1.15) \quad \begin{array}{ccc} & T(j) & \\ \phi_j \swarrow & & \searrow \phi'_j \\ c & \xrightarrow{g} & c' \end{array}$$

Let  $\text{Cocone}(T)$  be the *category of cocones* from  $T$ . Its vertices are cocones from  $T$ , and its arrows are morphisms of cocones from  $T$ .

**Definition 1.16.** Let  $T : \mathcal{J} \rightarrow \mathcal{C}$  be a functor. A *colimit* of  $T$  is an initial object in  $\text{Cocone}(T)$ .

If a colimit of  $T$  exists, it is unique up to unique isomorphism, and we denote its corresponding object in  $\mathcal{C}$  by  $\text{colim}(T)$ . The colimit  $\{\kappa_j : T(j) \rightarrow \text{colim}(T)\}_{\mathcal{J}}$  of  $T$  satisfies that given a cocone

$\{\phi_j : T(j) \rightarrow c\}_{\mathcal{J}}$  of  $T$  there exists a unique morphism  $h : \text{colim}(T) \rightarrow c$  such that  $h\kappa_j = \phi_j$  for all  $j$  in  $\mathcal{J}$ . Equivalently, for all objects  $j, j'$  in  $\mathcal{J}$  and all morphisms  $f : j \rightarrow j'$  the following diagram commutes.

$$(1.17) \quad \begin{array}{ccc} T(j) & \xrightarrow{T(f)} & T(j') \\ & \searrow \kappa_j & \swarrow \kappa_{j'} \\ & \text{colim}(T) & \\ & \vdots h & \\ & c & \end{array}$$

*(Note: Curved arrows  $\phi_j$  and  $\phi_{j'}$  also point from  $T(j)$  and  $T(j')$  respectively to  $c$ .)*

**Definition 1.18.** Let  $\mathcal{C}$  be a category. The *twisted arrow category*  $\text{Tw}(\mathcal{C})$  of  $\mathcal{C}$  has vertices  $f$  the morphisms of  $\mathcal{C}$ , and arrows  $f \rightarrow g$  between two morphisms  $f : c \rightarrow c'$  and  $g : d \rightarrow d'$  of  $\mathcal{C}$  pairs  $(l, r)$  where  $l : d \rightarrow c$  and  $r : c' \rightarrow d'$  are morphisms in  $\mathcal{C}$  such that  $g = rfl$ . Equivalently, the following diagram commutes.

$$(1.19) \quad \begin{array}{ccc} c & \xleftarrow{l} & d \\ f \downarrow & & \downarrow g \\ c' & \xrightarrow{r} & d' \end{array}$$

The opposite twisted arrow category  $\text{Tw}(\mathcal{C}^{op})^{op}$  of  $\mathcal{C}^{op}$  also has for vertices the morphisms of  $\mathcal{C}$ , and an arrow between two morphisms  $f : c \rightarrow c'$  and  $g : d \rightarrow d'$  of  $\mathcal{C}$  is given by a pair  $(l : d' \rightarrow c', r : c \rightarrow d)$  of morphisms in  $\mathcal{C}$  such that  $f = lgr$ .

$$\begin{array}{ccc} c & \xrightarrow{r} & d \\ f \downarrow & & \downarrow g \\ c' & \xleftarrow{l} & d' \end{array}$$

**Definition 1.20.** Let  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  be a functor and let  $f : c \rightarrow c'$ ,  $g : d \rightarrow d'$ ,  $r : c \rightarrow d$ ,  $l : d' \rightarrow c'$  be morphisms in  $\mathcal{C}$ . We define  $\lrcorner T(f) := T(c', c)$  and  $\lrcorner T(l, r) := T(l, r)$ .

**Definition 1.21.** Let  $S : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  and  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  be functors, let  $\eta : S \rightarrow T$  be a natural transformation, and let  $f : c \rightarrow c'$  be a morphism in  $\mathcal{C}$ . We define  $(\lrcorner \eta)_f := \eta_{(c', c)}$ .

**Definition 1.22.** Let  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  be a functor, let  $\alpha : T \rightarrow \Delta_d$  be a cowedge of  $T$ , let  $f : c \rightarrow c'$  be a morphism in  $\mathcal{C}$ . We define

$$(1.23) \quad \Psi(\alpha)_f := \alpha_c T(f, \text{id}_c) : T(c', c) \rightarrow d,$$

or equivalently

$$(1.24) \quad \Psi(\alpha)_f := \alpha_{c'} T(\text{id}_{c'}, f) : T(c', c) \rightarrow d.$$

The morphism  $\Psi(\alpha)_f$  is well defined because the following diagram commutes.

$$\begin{array}{ccc} T(c', c) & \xrightarrow{T(f, \text{id}_c)} & T(c, c) \\ T(\text{id}_{c'}, f) \downarrow & \searrow \Psi(\alpha)_f & \downarrow \alpha_c \\ T(c', c') & \xrightarrow{\alpha_{c'}} & d \end{array}$$

We denote by  $\Psi(\alpha)$  the family of morphisms  $\{\Psi(\alpha)_{f:c \rightarrow c'} : T(c', c) \rightarrow d\}_{\mathcal{C}}$ .

**Definition 1.25.** Let  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  be a functor, let  $d$  be an object in  $\mathcal{D}$ , and let  $\{\phi_f : \wr T(f) \rightarrow d\}_{\text{Tw}(\mathcal{C}^{op})^{op}}$  be a family of morphisms in  $\mathcal{D}$ . We define

$$(1.26) \quad \Phi(\phi)_c := \phi_{\text{id}_c} : T(c, c) \rightarrow d.$$

We denote by  $\Phi(\phi)$  the family of morphisms  $\{\Phi(\phi)_c : T(c, c) \rightarrow d\}_{\mathcal{C}}$ .

## 2. A RELATION BETWEEN COENDS AND COLIMITS

*Remark 2.1.* Let  $T : \mathcal{J} \rightarrow \mathcal{C}$  be a functor, let  $c$  be an object in  $\mathcal{C}$ , and let  $\phi : T \rightarrow \Delta_c$  be a natural transformation. Then the family  $\{\phi_i : T(i) \rightarrow c\}_{\mathcal{J}}$  of components of  $\phi$  is a cocone from  $T$  to  $c$ .

We now show the analogous statement for dinatural transformations and cocones.

**Proposition 2.2.** *Let  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  be a functor, then  $\wr T : \text{Tw}(\mathcal{C}^{op})^{op} \rightarrow \mathcal{D}$  is a functor.*

*Proof.* Note that an object in  $\text{Tw}(\mathcal{C}^{op})^{op}$  is given by a morphism  $f : c \rightarrow c'$  in  $\mathcal{C}$ , whence  $\wr T(f) = T(c', c)$  is an object in  $\mathcal{D}$ . Note that a morphism  $(l, r) : f \rightarrow g$  in  $\text{Tw}(\mathcal{C}^{op})^{op}$  from  $f : c \rightarrow c'$  to  $g : d \rightarrow d'$  morphisms in  $\mathcal{C}$  is given by morphisms  $l : d' \rightarrow c'$  and  $r : c \rightarrow d$  in  $\mathcal{C}$  such that  $f = lgr$ , whence  $\wr T(l, r) = T(l, r) : T(c', c) \rightarrow T(d', d)$  is a morphism in  $\mathcal{D}$ . Thus  $\wr T$  has the correct source  $\text{Tw}(\mathcal{C}^{op})^{op}$  and target  $\mathcal{D}$ . For  $f : c \rightarrow c'$  an object in  $\text{Tw}(\mathcal{C}^{op})^{op}$ , its identity morphism in  $\text{Tw}(\mathcal{C}^{op})^{op}$  is the pair  $\text{id}_f = (\text{id}_{c'}, \text{id}_c)$ . Consequently  $\wr T$  preserves identities because

$$\wr T(\text{id}_f) = \wr T(\text{id}_{c'}, \text{id}_c) = T(\text{id}_{c'}, \text{id}_c) = \text{id}_{T(c', c)} = \text{id}_{\wr T(f)}$$

by the functoriality of  $T$ . For  $(k : c' \rightarrow b', q : b \rightarrow c)$  and  $(l : d' \rightarrow c', r : c \rightarrow d)$  composable morphisms in  $\text{Tw}(\mathcal{C}^{op})^{op}$ , their composition is  $(kl : d' \rightarrow b', rq : b \rightarrow d)$ . Consequently  $\wr T$  preserves composition of morphisms because

$$\wr T((l, r)(k, q)) = \wr T(kl, rq) = T(kl, rq) = T(l, r)T(k, q) = \wr T(l, r)\wr T(k, q)$$

by the functoriality of  $T$ . □

**Proposition 2.3.** *Let  $S : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  and  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  be functors, let  $\eta : S \rightarrow T$  be a natural transformation. Then  $\wr \eta : \wr S \rightarrow \wr T$  is a natural transformation.*

*Proof.* Note that  $\wr S(f) = S(c', c)$ ,  $\wr T(f) = T(c', c)$ , and  $\eta_{(c', c)} : S(c', c) \rightarrow T(c', c)$ , whence  $(\wr \eta)_f = \eta_{(c', c)}$  has the correct source and target. Given  $f : c \rightarrow c'$  and  $g : d \rightarrow d'$  objects in  $\text{Tw}(\mathcal{C}^{op})^{op}$ , and  $(l, r) : f \rightarrow g$  a morphism in  $\text{Tw}(\mathcal{C}^{op})^{op}$ , and noticing that  $T(l, r)\eta_{(c', c)} = \eta_{(d', d)}S(l, r)$  because  $\eta$  is a natural transformation, then

$$\wr T(l, r)(\wr \eta)_f = T(l, r)\eta_{(c', c)} = \eta_{(d', d)}S(l, r) = (\wr \eta)_g \wr S(l, r).$$

Namely, the following diagram commutes, as desired.

$$\begin{array}{ccc} \wr S(f) & \xrightarrow{(\wr \eta)_f} & \wr T(f) \\ \wr S(l, r) \downarrow & & \downarrow \wr T(l, r) \\ \wr S(g) & \xrightarrow{(\wr \eta)_g} & \wr T(g) \end{array}$$

□

**Theorem 2.4.** *The assignment*

$$\begin{array}{ccc} \text{Func}(\mathcal{C}^{op} \times \mathcal{C}, \mathcal{D}) & \longrightarrow & \text{Func}(\text{Tw}(\mathcal{C}^{op})^{op}, \mathcal{D}) \\ T & \longmapsto & \wr T \\ \eta & \longmapsto & \wr \eta \end{array}$$

*yields a functor*  $\wr : \text{Func}(\mathcal{C}^{op} \times \mathcal{C}, \mathcal{D}) \rightarrow \text{Func}(\text{Tw}(\mathcal{C}^{op})^{op}, \mathcal{D})$ .

*Proof.* Note  $\wr$  is well defined because  $\wr T$  is an object in  $\text{Func}(\text{Tw}(\mathcal{C}^{op})^{op}, \mathcal{D})$  by Proposition 2.2 and  $\wr T$  is a morphism in  $\text{Func}(\text{Tw}(\mathcal{C}^{op})^{op}, \mathcal{D})$  by Proposition 2.3. Note  $\wr$  preserves identities because for all objects  $f : c \rightarrow c'$  in  $\text{Tw}(\mathcal{C}^{op})^{op}$  then

$$(\wr \text{id}_T)_f = (\text{id}_T)_{(c',c)} = \text{id}_{T(c',c)} = \text{id}_{\wr T(f)} = (\text{id}_{\wr T})_f$$

by the functoriality of  $T$  and  $\wr T$ , whence  $\wr \text{id}_T = \text{id}_{\wr T}$ . Note  $\wr$  preserves composition of morphisms because given  $\eta : S \rightarrow T$  and  $\theta : T \rightarrow U$  then for all objects  $f : c \rightarrow c'$  in  $\text{Tw}(\mathcal{C}^{op})^{op}$  we have

$$(\wr(\theta\eta))_f = (\theta\eta)_{(c',c)} = \theta_{(c',c)}\eta_{(c',c)} = (\wr\theta)_f(\wr\eta)_f.$$

□

**Proposition 2.5.** *Let*  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  *be a functor and let*  $\{\phi_f : \wr T(f) \rightarrow d\}_{\text{Tw}(\mathcal{C}^{op})^{op}}$  *be a cocone from*  $\wr T$  *to*  $d$ . *Then*  $\Phi(\phi)$  *is a cowedge for*  $T$ .

*Proof.* Recall that  $\Phi(\phi)$  is  $\{\Phi(\phi)_c : T(c, c) \rightarrow d\}_c$ . Given  $f : c \rightarrow c'$  an object in  $\text{Tw}(\mathcal{C}^{op})^{op}$ , the pairs  $(f, \text{id}_c) : f \rightarrow \text{id}_c$  and  $(\text{id}_{c'}, f) : \text{id}_{c'} \rightarrow f$  are morphism in  $\text{Tw}(\mathcal{C}^{op})^{op}$ , whence

$$\begin{array}{ccc} T(c', c) & \xrightarrow{\wr T(f, \text{id}_c)} & T(c, c) \\ & \searrow \phi_f & \swarrow \phi_{\text{id}_c} \\ & & d \end{array} \quad \text{and} \quad \begin{array}{ccc} T(c', c) & \xrightarrow{\wr T(\text{id}_{c'}, f)} & T(c', c') \\ & \searrow \phi_f & \swarrow \phi_{\text{id}_{c'}} \\ & & d \end{array}$$

are commutative diagrams because  $\{\phi_f : \wr T(f) \rightarrow d\}_{\text{Tw}(\mathcal{C}^{op})^{op}}$  is a cocone from  $\wr T$  to  $d$ . Then

$$T(f, \text{id}_c)\alpha_c = \wr T(f, \text{id}_c)\phi_{\text{id}_c} = \phi_f = \wr T(\text{id}_{c'}, f)\phi_{\text{id}_{c'}} = T(\text{id}_{c'}, f)\alpha_{c'}.$$

Namely, the following diagram commutes, as desired.

$$\begin{array}{ccc} T(c', c) & \xrightarrow{T(f, \text{id}_c)} & T(c, c) \\ T(\text{id}_{c'}, f) \downarrow & \searrow \phi_f & \downarrow \phi_{\text{id}_c} \\ T(c', c') & \xrightarrow{\phi_{\text{id}_{c'}}} & d \end{array}$$

□

**Proposition 2.6.** *Let*  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  *be a functor and let*  $\alpha : T \rightarrow \Delta_e$  *be a cowedge for*  $T$ . *Then*  $\Psi(\alpha)$  *is a cocone from*  $\wr T$  *to*  $e$ .

*Proof.* Recall that  $\Psi(\alpha)$  is  $\{\Psi(\alpha)_{f:c \rightarrow c'} : T(c', c) \rightarrow e\}_{\text{Tw}(\mathcal{C}^{op})^{op}}$ . Given  $f : c \rightarrow c'$  and  $g : d \rightarrow d'$  objects in  $\text{Tw}(\mathcal{C}^{op})^{op}$ , and  $(l, r) : f \rightarrow g$  a morphism in  $\text{Tw}(\mathcal{C}^{op})^{op}$ , note that  $\wr T(f) = T(c', c)$  and  $f = lgr$ , in particular  $\alpha_f : \wr T(f) \rightarrow e$  has the correct source and target. Now

$$\begin{aligned} \alpha_g \wr T(l, r) &= \alpha_d T(g, \text{id}_{d'}) T(l, r) = \alpha_d T(lg, r) = \alpha_d T(lg, \text{id}_d) T(\text{id}_{c'}, r) \\ &= \alpha_{c'} T(\text{id}_{c'}, lg) T(\text{id}_{c'}, r) = \alpha_{c'} T(\text{id}_{c'}, lgr) = \alpha_{c'} T(\text{id}_{c'}, f) = \alpha_f \end{aligned}$$

by the functoriality of  $T$  and the dinaturality of  $\alpha$ . Namely, the following diagram commutes, as desired.

$$\begin{array}{ccccc}
 T(c', c) & \xrightarrow{T(l, r)} & & \xrightarrow{T(l, r)} & T(d, d') \\
 \downarrow T(\text{id}_c, f) & \searrow T(\text{id}_{c'}, r) & & \searrow T(lg, r) & \downarrow T(g, \text{id}_{d'}) \\
 T(c', c') & \xleftarrow{T(\text{id}_{c'}, lg)} & T(c', d) & \xrightarrow{T(lg, \text{id}_d)} & T(d, d) \\
 & \searrow \alpha_{c'} & & \searrow \alpha_d & \\
 & & e & & 
 \end{array}$$

□

**Proposition 2.7.** *Let  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  be a functor, let  $\{\phi_f : \wr T(f) \rightarrow d\}_{\text{Tw}(\mathcal{C}^{op})^{op}}$  and  $\{\phi'_f : \wr T(f) \rightarrow d'\}_{\text{Tw}(\mathcal{C}^{op})^{op}}$  be cocones, and let  $g : \phi \rightarrow \phi'$  be a morphism in  $\text{Cocone}(\wr T)$  given by a morphism  $g : d \rightarrow d'$  in  $\mathcal{D}$ . Then  $g : d \rightarrow d'$  induces a morphism  $\Phi(g) : \Phi(\phi) \rightarrow \Phi(\phi')$  in  $\text{Cowedge}(T)$ .*

*Proof.* Since  $g : d \rightarrow d'$  gives a morphism  $g : \phi \rightarrow \phi'$  in  $\text{Cocone}(\wr T)$ , then for all objects  $f : c \rightarrow c'$  in  $\text{Tw}(\mathcal{C}^{op})^{op}$  we have

$$\begin{array}{ccc}
 & T(c', c) & \\
 \phi_f \swarrow & & \searrow \phi'_f \\
 d & \xrightarrow{g} & d'
 \end{array}$$

so in particular for  $\text{id}_c : c \rightarrow c$  we have

$$\begin{array}{ccc}
 & T(c, c) & \\
 \phi_{\text{id}_c} \swarrow & & \searrow \phi'_{\text{id}_c} \\
 d & \xrightarrow{g} & d'
 \end{array}$$

which indeed induces a morphism  $\Phi(g) : \Phi(\phi) \rightarrow \Phi(\phi')$  in  $\text{Cowedge}(T)$ . Explicitly

$$g\Phi(\phi)_d = g\phi_{\text{id}_c} = \phi_{\text{id}_{c'}} = \Phi(\phi)_{d'}.$$

□

**Proposition 2.8.** *Let  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  be a functor, let  $\alpha : T \dashrightarrow \Delta_d$  and  $\alpha' : T \dashrightarrow \Delta_{d'}$  be cowedges, and let  $g : \alpha \rightarrow \alpha'$  be a morphism in  $\text{Cowedge}(T)$  given by a morphism  $g : d \rightarrow d'$  in  $\mathcal{D}$ . Then  $g : d \rightarrow d'$  induces a morphism  $\Psi(g) : \Psi(\alpha) \rightarrow \Psi(\alpha')$  in  $\text{Cocone}(\wr T)$ .*

*Proof.* Since  $g : d \rightarrow d'$  gives a morphism  $g : \alpha \rightarrow \alpha'$  in  $\text{Cowedge}(T)$ , then for all objects  $c$  in  $\mathcal{C}$  we have

$$\begin{array}{ccc}
 & T(c, c) & \\
 \alpha_d \swarrow & & \searrow \alpha'_{d'} \\
 d & \xrightarrow{g} & d'
 \end{array}$$

whence given a morphism  $f : c \rightarrow c'$  in  $\mathcal{C}$  we have

$$\begin{array}{ccc}
 & T(c', c) & \\
 \alpha_f \swarrow & \downarrow T(f, \text{id}_c) & \searrow \alpha'_f \\
 & T(c, c) & \\
 \alpha_d \swarrow & & \searrow \alpha'_{d'} \\
 d & \xrightarrow{g} & d'
 \end{array}$$

which indeed induces a morphism  $\Psi(g) : \Psi(\alpha) \rightarrow \Psi(\alpha')$  in  $\text{Cocone}(\wr T)$ . Explicitly

$$g\Psi(\alpha)_f = g\alpha_f = g\alpha_d T(f, \text{id}_c) = \alpha'_{d'} T(f, \text{id}_c) = \alpha'_f = \Psi(\alpha')_f.$$

□

**Theorem 2.9.** *The assignments*

$$\begin{array}{ccc}
 \text{Cowedge}(T) & \longleftrightarrow & \text{Cocone}(\wr T) \\
 \alpha & \longmapsto & \Psi(\alpha) \\
 \Phi(\phi) & \longleftarrow & \phi
 \end{array}$$

induce an equivalence of categories  $\text{Cocone}(\wr T) \simeq \text{Cowedge}(T)$ .

*Proof.* Note  $\Psi$  is well defined because  $\Psi(\alpha)$  is an object in  $\text{Cocone}(\wr T)$  by Proposition 2.6, and a morphism in  $\text{Cocone}(\wr T)$  is sent to a morphism in  $\text{Cowedge}(T)$  by Proposition 2.8. Note  $\Phi$  is well defined because  $\Phi(\phi)$  is an object in  $\text{Cowedge}(T)$  by Proposition 2.5, and a morphism in  $\text{Cowedge}(T)$  is sent to a morphism in  $\text{Cocone}(\wr T)$  by Proposition 2.7. Moreover,  $\Phi$  preserves identities because given  $\text{id}_\phi : \phi \rightarrow \phi$  in  $\text{Cocone}(\wr T)$  induced by  $\text{id}_d : d \rightarrow d$ , then  $\Phi(\text{id}_\phi)$  and  $\text{id}_{\Phi(\phi)}$  are both induced by  $\text{id}_d : d \rightarrow d$ , whence  $\Phi(\text{id}_\phi) = \text{id}_{\Phi(\phi)}$ . Also,  $\Phi$  preserves composition because given  $g : \phi \rightarrow \phi'$  and  $h : \phi' \rightarrow \phi''$  morphisms in  $\text{Cocone}(\wr T)$ , induced by  $g : d \rightarrow d'$  and  $h : d' \rightarrow d''$  respectively, then  $\Phi(h)\Phi(g)$  and  $\Phi(hg)$  are both induced by  $hg : d \rightarrow d''$ , whence  $\Phi(h)\Phi(g) = \Phi(hg)$ . Finally,  $\Phi$  is full, faithful, and essentially surjective by Propositions 2.7, 2.6, 2.5, and 2.8. □

**Theorem 2.10.** *Let  $T : \mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{D}$  be a functor. Then*

$$\int^{x \in \mathcal{C}} T(x, x) \cong \Phi(\text{colim}(\wr T)) \quad \text{and} \quad \Psi\left(\int^{x \in \mathcal{C}} T(x, x)\right) \cong \text{colim}(\wr T).$$

*Proof.* Since  $\text{colim}(\wr T)$  is an initial object in  $\text{Cocone}(\wr T)$ , which is equivalent to  $\text{Cowedge}(T)$  by Theorem 2.9, and equivalences of categories preserve initial objects, we obtain that  $\Phi(\text{colim}(\wr T))$  is an initial object in  $\text{Cowedge}(T)$ . Since  $\int^{x \in \mathcal{C}} T(x, x)$  is an initial object in  $\text{Cowedge}(T)$ , we have  $\int^{x \in \mathcal{C}} T(x, x) \cong \Phi(\text{colim}(\wr T))$ . Thus  $\Psi\left(\int^{x \in \mathcal{C}} T(x, x)\right) \cong \Psi(\Phi(\text{colim}(\wr T))) \cong \text{colim}(\wr T)$ . □
